Param domain for processed USGS and UMD ...

[emkemp](#) 3 posts since

Mar 9, 2009 I'm setting up LIS6 with three domains corresponding with a planned WRF setup. The LIS run will use USGS land cover and FAO-STATSGO soil texture data. I've used the data_proc programs to remap the land use, soil type, etc. to the resolutions of the three domains (30 km, 10 km, and 3.333 km). However, I do not know the domain information (lower left lat, dimension size, etc.) corresponding to these param fields.

Is there software available to calculate this? Tags: lis, landcover, grid, data
